

## Red Hat and Amazon Web Services

# Pushing Boundaries & Breaking Barriers in the Cloud

### Scale infrastructure and expand opportunities in line with your organization's needs and business goals.

Red Hat and AWS help you accelerate new product development, optimize processes, and adopt innovative container and cloud technology to increase business agility and success. Together, Red Hat® and Amazon Web Services (AWS) give you the tools and technologies to adapt to market demands.

Presidio helps accelerate adoption of Red Hat on AWS. Through the combined use of OpenShift and Ansible, we can build and modernize applications and help automate the development process. The strength of our team is that in addition to full-stack development capabilities, we're grounded in DevOps, Automation, Data and Cloud-Native principles. This allows us to modernize faster.

Amazon Web Services (AWS) and Red Hat provide a complete, enterprise-class computing environment. Red Hat solutions on AWS give customers the ability to run enterprise traditional on-premises applications, such as SAP, Oracle databases, and custom applications in the cloud. Customers benefit from the familiar interface and consistent environment of Red Hat Enterprise Linux (RHEL) and the simplicity and scalability of AWS.

- 1 Optimize business processes to reduce time to market. Make your business more efficient and deliver products faster with innovative technology solutions.
- 2 Adopt new technology to become more agile without restructuring. Integrate new technology into current processes to increase business performance and agility.

Contact Presidio today to engage with both Red Hat and AWS, and develop a world-class solution for your organization.
